

ClawVAPT

Telegram-first multi-agent VAPT assistant with verified scope, QRIS credits, public GitHub scanning, and report automation.

OpenClaw2026_ZaiZai_ClawVAPT

- Built for security operators and small teams that need fast, safe vulnerability triage.
- Runs from Telegram: no dashboard needed for MVP.
- Live bot: @capithon_bot | Repo: github.com/vuckuola/OpenClaw2026_ZaiZai_ClawVAPT

Problem

- VAPT tools are powerful but easy to misuse without ownership verification and scope control.
- Operators waste time stitching together scanners, payment/access control, evidence redaction, and reports.
- Small teams need client-ready output, not raw terminal logs.
- Payment gating is usually outside the security workflow, making monetization awkward.

Solution

- Telegram bot guides the user through web target verification, scan approval, credit checks, and report delivery.
- Web scans require HTTP/DNS ownership proof and a locked scope before any scanner runs.
- Public GitHub repo scans are standalone, limited to one scan per repo/account, and cost 25 credits.
- Pakasir QRIS top-up is integrated directly into the agent flow.
- Reports are delivered automatically: PDF, JSON, and manual-review checklist.

Multi-Agent Workflow

Agent	Responsibility
TrustVerifierPaymentAgent	Ownership proof, scope lock, credits, Pakasir QRIS
RedTeamRepoScannerAgent	Safe/deep web checks, public repo scans, tool adapters
BlueTeamHardeningReportAgent	PDF/JSON/manual review reports and remediation guidance
MainOrchestrator	State machine, audit trail, safety gates, Telegram UX

- Autonomous loop: validate → verify/pay → run tools → redact → report → persist audit trail.
- Optional OpenClawBridge sends sanitized advisory envelopes for AI security review.

Impact & Roadmap

- Impact: safer, faster security triage for freelancers, agencies, and small product teams.
- Real-world deployability: Node.js, TypeScript, SQLite, PM2, Telegram, Pakasir QRIS, reproducible README.
- Current: Telegram-first MVP, verified web scans, public GitHub scans, QRIS credits, reports.
- Roadmap: dashboard UI, GitHub App for private repos, RAG remediation knowledge base, team workspaces.
